

The listing of claims will replace all prior versions, and listings of claims in the application.

- (currently amended) A method for receiving an optical data signal, comprising: 1.
 - **(1)** receiving an optical data signal;
- converting the optical data signal to an electrical signal having a symbol (2)rate;
 - generating N sampling signals having a first frequency that is lower than (3) the symbol rate, the N sampling signals shifted in phase relative to one another, wherein N is an integer greater than one;
 - controlling N analog-to-digital converter ("ADC") paths with the N (4) sampling signals to sample the electrical signal at the phases, to produce samples;
 - (5) performing at least one M-path parallel digital process on the samples, wherein M is not equal to N M=kN and k is one of an integer greater than one and 1/s, where s is an integer greater than one; and
 - (6) generating a digital signal representation of the optical data signal from the samples.
- 2. (previously presented) The method according to claim 1, wherein step (5) further comprises performing an equalization process on the samples.
- 3. (previously presented) The method according to claim 2, wherein step (5) further comprises performing a Viterbi equalization process on the samples.

- 4. (previously presented) The method according to claim 2, wherein step (5) further comprises performing a feed-forward equalization process on the samples.
- 5. (previously presented) The method according to claim 2, wherein step (5) further comprises performing a decision feedback equalization process on the samples.
- 6. (previously presented) The method according to claim 2, wherein step (5) further comprises performing Viterbi equalization and feed-forward equalization processes on the samples.
- 7. (previously presented) The method according to claim 2, wherein step (5) further comprises performing Viterbi equalization and decision feedback equalization processes on the samples.
- 8. (previously presented) The method according to claim 2, wherein step (5) further comprises:

performing one or more of the following types of equalization processes on the samples:

Viterbi equalization;

feed-forward equalization; and

decision feedback equalization.

9. (currently amended) An optical receiver, comprising:

a receiver input;

an optical-to-electrical converter coupled to the receiver input;

an analog-to-digital converter ("ADC") array of N ADC paths, wherein N is an integer greater than 1, each ADC path including an ADC path input coupled to an output of the optical-to-electrical converter; and

an M-path digital signal processor coupled to the ADC array, wherein M is not equal to N M-kN and k is one of an integer greater than one and 1/s, where s is an integer greater than one.

- 10. (previously presented) The optical receiver according to claim 9, wherein the digital signal processor includes an equalizer.
- 11. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a Viterbi equalizer.
- 12. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a feed-forward equalizer.
- 13. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a decision feedback equalizer.

- 14. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a Viterbi equalizer and a feed-forward equalizer.
- 15. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a Viterbi equalizer and a decision feedback equalizer.
- 16. (previously presented) The optical receiver according to claim 10, wherein the equalizer comprises a feed-forward equalizer and a decision feedback equalizer.
- 17. (previously presented) The optical receiver according to claim 10 wherein the equalizer comprises one or more of:
 - a Viterbi equalizer;
 - a feed-forward equalizer; and
 - a decision feedback equalizer.
- 18. *(currently amended)* An optical receiver, comprising:

means for receiving an optical data signal;

means for converting the optical data signal to an electrical signal having a symbol rate;

means for generating N sampling signals having a first frequency that is lower than the symbol rate, the N sampling signals shifted in phase relative to one another;

means for controlling N analog-to-digital converter ("ADC") paths with the N sampling signals to sample the electrical signal at the phases to produce samples;

means for performing at least one M-path parallel digital process on the samples, wherein M is not equal to N M-kN and k is one of an integer greater than one and 1/s, where s is an integer greater than one; and

means for generating a digital signal representation of the optical data signal from the samples.

- 19. (previously presented) The system according to claim 18, wherein the means for performing digital processes on the samples include means for equalizing the samples.
- 20. (previously presented) The system according to claim 19, wherein the means for equalizing the samples comprise means for performing a Viterbi equalization process on the samples.
- 21. (previously presented) The system according to claim 19, wherein the means for equalizing the samples comprise means for performing a feed-forward equalization process on the samples.
- 22. (previously presented) The system according to claim 19, wherein the means for equalizing the samples comprise means for performing a decision feedback equalization process on the samples.

- 23. (previously presented) The system according to claim 19, wherein the means for equalizing the samples comprise means for performing Viterbi equalization and feed-forward equalization processes on the samples.
- 24. (previously presented) The system according to claim 19, wherein the means for equalizing the samples comprises means for performing Viterbi equalization and decision feedback equalization processes on the samples.
- 25. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a multimode optical fiber and step (5) comprises equalizing multimode dispersion from the multimode optical fiber.
- 26. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a single mode optical fiber and step (5) comprises equalizing chromatic and/or waveguide dispersion from the single mode optical fiber.
- 27. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a multimode optical fiber and step (5) comprises equalizing chromatic and/or waveguide dispersion from the multimode optical fiber.

- 28. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a single mode optical fiber and step (5) comprises equalizing polarization mode dispersion from the single mode optical fiber.
- 29. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a single mode optical fiber and step (5) comprises equalizing dispersion induced in the single mode optical fiber by laser chirping.
- 30. (previously presented) The method according to claim 2, wherein step (1) comprises receiving the optical data signal from a transmitter that lacks external modulators, and step (5) comprises equalizing excess dispersion induced by laser chirping.
- 31. (previously presented) The optical receiver according to claim 10, wherein the input is coupled to a multimode optical fiber and the equalizer equalizes multimode dispersion from the multimode optical fiber.
- 32. (previously presented) The optical receiver according to claim 10, wherein the input is coupled to a single mode optical fiber and the equalizer equalizes chromatic and/or waveguide dispersion from the single mode optical fiber.

- 33. (previously presented) The optical receiver according to claim 10, wherein the input is coupled to a multimode optical fiber and the equalizer equalizes chromatic and/or waveguide dispersion in the multimode optical fiber.
- 34. (previously presented) The optical receiver according to claim 10, wherein the input is coupled to a multimode optical fiber and the equalizer equalizes polarization mode dispersion from the single mode optical fiber.
- 35. (previously presented) The optical receiver according to claim 10, wherein the input is coupled to a single mode optical fiber and the equalizer equalizes dispersion induced in the single mode optical fiber by laser chirping.
- 36. (previously presented) The optical receiver according to claim 10, wherein the input receives the optical data signal from a transmitter that lacks external modulators, and the equalizer equalizes excess dispersion induced by laser chirping.
- 37. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal is coupled to a multimode optical fiber and the means for equalizing comprises means for equalizing multimode dispersion from the multimode optical fiber.
- 38. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal is coupled to a single mode optical fiber and the

means for equalizing comprises means for equalizing chromatic and/or waveguide dispersion from the single mode optical fiber.

- 39. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal is coupled to a multimode optical fiber and the means for equalizing comprises means for equalizing chromatic and/or waveguide dispersion in the multimode optical fiber.
- 40. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal is coupled to a multimode optical fiber and the means for equalizing comprises means for equalizing polarization mode dispersion from the single mode optical fiber.
- 41. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal is coupled to a single mode optical fiber and the means for equalizing comprises means for equalizing dispersion induced in the single mode optical fiber by laser chirping.
- 42. (previously presented) The optical receiver according to claim 19, wherein the means for receiving an optical signal receives the optical data signal from a transmitter that lacks external modulators, and the means for equalizing comprises means for equalizing excess dispersion induced by laser chirping.

- 43. (previously presented) The method according to claim 1, wherein step (5) comprises decoding a convolutional code.
- 44. (previously presented) The method according to claim 1, wherein step (5) comprises decoding a trellis code.
- 45. (previously presented) The method according to claim 1, wherein step (5) comprises decoding a block code.
- 46. (previously presented) The optical receiver according to claim 9, wherein the digital signal processor comprises a convolutional decoder.
- 47. (previously presented) The optical receiver according to claim 9, wherein the digital signal processor comprises a trellis decoder.
- 48. (previously presented) The optical receiver according to claim 9, wherein the digital signal processor comprises a block decoder.
- 49. (previously presented) The optical receiver according to claim 18, wherein the means for performing digital processes on the samples comprises means for decoding a convolutional code.

- 50. (previously presented) The optical receiver according to claim 18, wherein the means for performing digital processes on the samples comprises means for decoding a trellis code.
- 51. (previously presented) The optical receiver according to claim 18, wherein the means for digitally performing digital processes on the samples comprises means for decoding a block code.
- 52. (New) The method according to claim 1, wherein M equals 2N.
- 53. (New) The method according to claim 1, wherein N is greater than M.
- 54. (New) The optical receiver according to claim 9, wherein M equals 2N.
- 55. (New) The optical receiver according to claim 9, wherein N is greater than M.
- 56. (New) The system according to claim 18, wherein M equals 2N.
- 57. (New) The system according to claim 18, wherein N is greater than M.
